

Warfront - Updated Design Document (Revision IV)

Core Vision

Warfront is not intended to be another invasion mod or strategy mod. It is a progression system that continuously creates meaningful objectives for the player while integrating naturally with industrial and engineering gameplay.

The project exists to answer one question that many automation-heavy Minecraft packs fail to answer:

"What should I build next, and why?"

Instead of relying on quest books or arbitrary checklists, the world itself should generate objectives.

Players should feel that every factory, railway, bunker, vehicle, refinery and outpost exists because the current strategic situation requires it.

The war exists to generate reasons for progression.

Core Design Philosophy

Warfront is built around three separate concepts.

1. Purpose

Everything the player builds should have a practical reason.

Examples:

- Build a railway because an iron deposit is 1800 blocks away.
- Build a helicopter because a command center is deep inside enemy territory.
- Build a refinery because military vehicles require fuel.
- Build artillery because direct assaults have become expensive.

The objective should naturally justify the infrastructure.

2. Direction

The player should almost always know what the next achievable objective is.

Example:

"I want to unlock the End."

↓

Need portal components.

↓

Need to raid command centers.

↓

Need stronger weapons.

↓

Need better ammunition.

↓

Need more production.

↓

Need additional ore.

↓

Need new logistics.

Like GT New Horizons, major objectives should naturally decompose into many satisfying sub-goals.

No quest book should be necessary for this progression to make sense.

3. Pressure

Unlike GTNH, Warfront also contains world pressure.

Enemy offensives.

Territory expansion.

Regional attacks.

Command center growth.

However, pressure exists to reinforce purpose—not to constantly punish the player.

The player is expected to make strategic decisions rather than extinguish endless fires.

Campaign Structure

Chapter 1

Early Survival

Player explores.

Manual TACZ ammunition crafting.

Simple farming.

Basic Create machines.

Local transportation.

Chapter 2

Regional Expansion

Player begins claiming territory.

Ore deposits become valuable.

Railways begin connecting facilities.

Vehicles start replacing walking.

Small command centers become attack targets.

Chapter 3

Industrial Warfare

Large factories.

Oil refining.

Heavy logistics.

Advanced ammunition production.

Aircraft.

Artillery.

Tanks.

Command centers become strategic objectives.

Chapter 4

End Portal Reconstruction

The End is no longer a simple vanilla milestone.

Strongholds still exist.

Players can still discover them naturally.

However, the portal requires reconstruction.

Portal activation components are recovered from enemy strategic locations.

Possible sources include:

- Pillager Command Centers
- Major Zombie Hives
- Piglin Expeditions

This creates another long-term strategic objective while still allowing skilled players to obtain components through risky infiltration rather than overwhelming force.

The game rewards tactical intelligence instead of enforcing hard level gates.

Chapter 5

Ender Arrival

Defeating the Ender Dragon weakens the dimensional barriers.

The Ender Ascendancy begins entering the Overworld.

This is intended as the second major campaign rather than another faction being present from world generation.

Players who rush this stage intentionally are allowed to do so.

The game does not forbid it.

The challenge itself becomes the consequence.

Factions

Pillagers

Theme:

Strategic military faction.

Behavior:

Attempts to move fronts toward player influence.

Encircles advances.

Launches organized attacks.

Establishes fortified command centers.

Rewards:

Technology.

Vehicle blueprints.

Military equipment.

Portal reconstruction components.

Zombies

Theme:

Mindless overwhelming infection.

Behavior:

Expands randomly.

Eventually focuses entirely on player territory.

Easy to manipulate strategically.

Extremely dangerous through numbers.

Rewards:

Biological materials.

Portal reconstruction components.

Piglins (Future Update)

Theme:

Neutral industrial civilization.

Behavior:

Appear through temporary Nether incursions.

Harvest resources.

Trade if left alone.

Become hostile if attacked.

Players choose diplomacy or war.

Not a permanent territorial faction.

Rewards:

Rare alloys.

Unique resources.

Portal reconstruction components.

Ender Ascendancy (Major Expansion)

Theme:

Interdimensional civilization.

Triggered only after defeating the Ender Dragon.

Specialization:

Advanced levitation technology.

Dimensional engineering.

High mobility.

Dimensional anchors.

War striders.

Small aerial craft.

Eventually larger levitation-based military assets.

Rather than tanks and helicopters fighting pillagers,

players now fight technologically superior enemies using reverse-engineered levitation technology discovered throughout the campaign.

Player Freedom

Warfront intentionally avoids solving encounters for the player.

Every command center should support multiple valid strategies.

Examples:

Full assault using armored vehicles.

Artillery bombardment.

Massive aerial bombing.

Helicopter insertions.

Silent commando infiltration.

Underground tunneling.

Bridge construction.

Diversion attacks.

Demolitions.

Players should constantly discover ridiculous but legitimate Minecraft solutions.

If someone builds a gigantic TNT airship and destroys half a command center,

the appropriate reaction should be:

"Only in Minecraft."

Creativity should always compete with conventional military doctrine.

Command Centers

Command centers are intended to become miniature military sandboxes.

Possible contents:

Barracks.

Ammo depots.

Fuel storage.

Blueprint caches.

Radar stations.

Vehicle hangars.

AA emplacements.

Turrets.

Watch towers.

Commander buildings.

Players may complete objectives loudly or quietly.

Silent infiltration can destabilize a region by eliminating commanders before full combat begins.

Blueprint Philosophy

Blueprints are intended to lower the barrier of entry.

Many Create Aeronautics vehicles require enormous engineering knowledge.

Normal players should not need to reproduce dozens of hours of engineering work.

Instead they discover complete vehicle schematics.

Examples:

1967 Mustang Mach 1

UH-1 Huey

Military trucks

Starter tanks

Utility helicopters

Players gather materials.

Assemble them.

Learn from them.

Experienced engineers remain free to design their own specialized vehicles.

Blueprints become education rather than limitation.

Industrial Integration

Warfront assumes industrial gameplay.

Factories are not optional decorations.

Industry supports:

Fuel.

Ammunition.

Vehicle production.

Construction materials.

Rail logistics.

Power.

Automation.

Create remains the backbone of progression.

Regional Resource Design

Ore deposits intentionally appear thousands of blocks apart.

This encourages:

Railways.

Regional outposts.

Long-distance logistics.

Oil fields become biome-dependent.

Example:

Large petroleum deposits mostly appear in deserts.

Players without oil access may continue using biodiesel as a slower alternative.

The goal is not to punish players.

The goal is to naturally justify expanding infrastructure.

Local War Map

The strategic map intentionally does not reveal the entire world.

Default operational radius:

Approximately 1024×1024 blocks centered on the player.

This represents the player's current theater of operations.

Benefits:

Maintains exploration.

Prevents overpowered scouting.

Keeps intelligence valuable.

The player gradually learns the world instead of immediately knowing everything.

Postgame Reward

Defeating the Ender Ascendancy should not simply reward infinite resources.

Instead the player unlocks:

Dimensional Survey Technology (DST)

DST represents a civilization-scale surveillance network constructed using recovered Ender technology.

Possible implementation:

Large radar installation.

Create optics.

ComputerCraft terminals.

Ender energy.

Internally it locates world structures and strategic resources.

Rather than revealing the world automatically,

players perform individual surveys.

Examples:

Locate oil fields.

Locate ore deposits.

Locate strongholds.

Locate blueprint caches.

Locate ancient structures.

Locate remaining enemy facilities.

DST transforms exploration from manual scouting into strategic planning.

This creates meaningful postgame progression instead of larger numbers.

Information Progression

The player's knowledge evolves throughout the campaign.

Early Game

Unknown world.

↓

Mid Game

Local scouting.

↓

Regional War Map

1024 block operational intelligence.

↓

Aircraft reconnaissance.

↓

Late Game

Dimensional Survey Technology.

Global strategic intelligence.

The player evolves from survivor to commander to civilization.

Risk Philosophy

Warfront intentionally rewards player skill.

Highly experienced players may attempt difficult objectives early.

Examples:

Stealth raids.

Portal component recovery.

Dragon kill before industrialization.

The game does not prevent these approaches.

Instead it trusts players to accept the strategic consequences.

Preparation remains valuable.

Creativity remains valuable.

Skill remains valuable.

None of these should invalidate the others.

Intended Player Experience

A successful Warfront campaign should feel like building an entire nation.

The player begins surviving.

Then industrializes.

Then builds logistics.

Then expands strategically.

Then wages increasingly sophisticated wars.

Finally defeats the Ender Ascendancy.

After victory,

the player possesses not merely larger factories,

but complete understanding and control of the world they have transformed.

The campaign should conclude with satisfaction rather than exhaustion.

The player has achieved something tangible.

Further expansion becomes a personal choice instead of an endless obligation.

Warfront is ultimately not a war simulator.

It is a progression engine that gives engineering, logistics and military creativity a meaningful purpose within Minecraft.
